Understanding Mercury and how it formed is critical to better understanding the conditions on and evolution of the inner planets. Fortified against the searing conditions near the Sun, MESSENGER will provide the first images of the entire planet. The mission will also collect detailed information on the composition and structure of Mercury’s crust, its geologic history, the nature of its thin atmosphere and active magnetosphere, and the makeup of its core and polar materials. On a 4.9-billion mile (7.9-billion kilometer) journey that includes 15 loops around the Sun, MESSENGER’s trajectory includes one pass at Earth, two by Venus, and three by Mercury, before easing into orbit around its target planet. The Earth flyby in August 2005, the first Venus flyby in October 2006, and the Venus 2 encounter in June 2007 used the pull of the planets’ gravity to guide solar-powered MESSENGER toward Mercury’s orbit. The Mercury flybys in January 2008, October 2008, and September 2009 fine-tune and slow MESSENGER’s track while allowing the spacecraft to gather data critical to planning the mission’s orbit phase.

MESSENGER’s science payload was carefully chosen to answer the mission’s six key science questions. Most of the instruments are fixed rigidly to the spacecraft’s body, so coverage of Mercury is obtained by spacecraft motion over the planet.

Those instruments are:
- **Mercury Dual Imaging System (MDIS)** – Applied Physics Laboratory
- **Gamma-Ray and Neutron Spectrometer (GRNS)** – Applied Physics Laboratory
- **X-Ray Spectrometer (XRS)** – Applied Physics Laboratory
- **Magnetometer (MAG)** – joint Applied Physics Laboratory and NASA’s Goddard Space Flight Center
- **Mercury Laser Altimeter (MLA)** – Goddard Space Flight Center
- **Mercury Atmospheric and Surface Composition Spectrometer (MASCS)** – Laboratory for Atmospheric and Space Physics, University of Colorado at Boulder
- **Energetic Particle and Plasma Spectrometer (EPPS)** – joint Applied Physics Laboratory and University of Michigan
- **Radio Science (RS)** – Applied Physics Laboratory
**MISSION**

*Launch:* August 3, 2004, from Launch Pad 17B at Cape Canaveral Air Force Station, Fla., at 2:15:56 a.m. EDT aboard a Boeing Delta II rocket

*Enter Mercury orbit:* March 2011

Total distance traveled from Earth to Mercury orbit: 7.9 billion kilometers (4.9 billion miles). Spacecraft circles the Sun 15 times from launch to Mercury orbit

*Primary mission at Mercury:* Orbit for one Earth year (equivalent to four Mercury years, or two Mercury solar days), collecting data on the composition and structure of Mercury’s crust, its topography and geologic history, the nature of its thin atmosphere and active magnetosphere, and the makeup of its core and polar materials

**SPACECRAFT**

*Size:* Main spacecraft body is 1.42 meters (56 inches) tall, 1.85 meters (73 inches) wide and 1.27 meters (50 inches) deep; front-mounted ceramic-fabric sunshade is 2.5 meters tall and 2 meters across (8 feet by 6 feet); two rotatable solar panel “wings” extend about six meters (20 feet) from end to end across the spacecraft

*Launch weight:* Approximately 1,107 kilograms (2,441 pounds); includes about 599 kilograms (1,320 pounds) helium pressurant and propellant and 508 kilograms (1,121 pounds) “dry” spacecraft and instruments

*Power:* Two body-mounted gallium arsenide solar panels; nickel-hydrogen battery

*Propulsion:* One bipropellant (hydrazine and nitrogen tetroxide) thruster for large maneuvers; 16 hydrazine-fueled thrusters for small trajectory adjustments and attitude control

*Science instruments:* Wide-angle color and narrow-angle monochrome imager; gamma-ray and neutron spectrometer; X-ray spectrometer; energetic particle and plasma spectrometer; atmospheric and surface composition spectrometer; laser altimeter; magnetometer; radio science experiment

**MESSENGER Cruise Phase**

Distance traveled: 4.9 billion miles

Cruise Duration: 6.6 years

15 trips around the Sun

6 planetary flybys
